Office of Housing, Policy, Planning, and Evaluation
Patti Holland, Assistant Director

MENTAL HEALTH AND ORAL HEALTH
Filling the Gap

Stigma
Mental health stigma is seen as the last frontier of discrimination and, dental health care possesses its own stigma. Individuals who might be proactive about health in regard to fitness, nutrition, and disease prevention may not include dental and mental health in their health agenda. Additionally, both mental and dental health are underinsured and as such, too often neglected because of financial stress.
Filling the Gap

Understanding Mental Health Stigma

- Cancer is contagious?

- Disconnection---Disparity---Discrimination

- Universality

Filling the Gap

People

When we discriminate against someone with mental illness, we are discriminating against our mothers and fathers, daughters and sons, sisters and brothers, friends, neighbors, and colleagues. NAMI NJ’s Film, “Documenting our Presence - A Multicultural Journey Through Mental Illness” provides a lens through which we can see the process of wellness and recovery across cultural and gender lines, and across the life span. These individuals could be any one of your patients and/or their loved ones.

Mental Illness and Oral Health
Filling the Gap

Facts about Mental Illness

- Mental Illnesses are biologically based brain disorders.
- Types of mental illnesses include:
  - *Thought Disorders*: Schizophrenia
  - *Mood Disorders*: Major Depression; Bipolar Disorder
  - *Anxiety Disorders*:
    - Obsessive-Compulsive Disorder
    - Post Traumatic Stress Disorder
    - Generalized Anxiety Disorder
Filling the Gap

Signs of Mental Illness

- Problems with Thinking - delusions, hallucinations, can’t think abstractly, confusion, inability to concentrate
- Problems with Feelings - depression, euphoria, anxiety
- Problems with Socializing
- Problems with Functioning
- Poor Self Care
Relevant Statistics

- 1 in 4 adults – approximately 57.7 million Americans experience mental health disorders in a given year. 1 in 17 live with serious mental illness such as Schizophrenia, Major Depression or Bipolar Disorder
- Serious mental illness effects about 6% of population
- Fewer than 1/3 of adults with diagnosable mental disorders receive any treatment.
- Consequences of lack of treatment include unnecessary disability, unemployment, poverty, substance abuse, homelessness, inappropriate incarceration.
Filling the Gap

Co-occurring Disorders

- Individuals with mental illness face an increased risk of having chronic medical conditions.
- Adults with serious mental illness die 25 years younger than other Americans, largely due to treatable medical conditions.
Filling the Gap

Treatment is Effective

The best treatments for serious mental illnesses today are highly effective; between 70-90% of individuals have significant reduction of symptoms and improved quality of life with a combination of pharmacological, psychosocial and rehabilitative treatments and interventions.

*Early intervention and treatment is vital for the most positive long term prognosis.*
## Frequently Prescribed Medications

Filling the Gap

The adverse effects of psychotropic drugs may cause dental problems

- Xerostomia – ‘dry mouth’ most frequent side effect of many drugs, and complaint by individuals.
- Bruxism
- Surgical bleeding in individuals taking Sodium Valproate for Bipolar Disorder. Can impair platelet aggregation. Milder with SSRI antidepressant
- Drug induced excessive salivation in Clozapine
Factors that contribute to poor oral health

- Poor self care skills
- Low self esteem
- Fear, anxiety
- Poverty
- Poor diet
- Excessive smoking
- Excessive drinking of sugary fluids to combat ‘dry mouth’
- Substance abuse
Factors that contribute to poor oral health

- Lack of access to dental professionals
- Lack of dental professionals interested in treating those with serious mental illness
- Lack of adequate healthcare insurance
- Lack of knowledge about oral healthcare
- Lack of assistance and support to follow through with oral healthcare
Oral manifestations that may be associated with mental health issues

- Preoccupations beyond normal ‘dental anxiety’, facial pain or signs of self injury
- Enamel erosion - possibly from bulimic behavior
- Periodontal disease or oral infections due neglect, poor diet, or excessive smoking
- Temperomandibular joint dysfunction (TMJ) or palatal erosion
- Reduction in salivary secretions very common side effect of many medications and has significant impact on oral health
- Dyskinesia and dystonia also common side effects and characterized by tongue protrusion, facial grimacing, abnormal jaw movements.
Filling the Gap

Wellness and Recovery

The National trend has been to transform public mental health systems towards one more aligned with principles of Recovery. New Jersey has included Wellness

“A deeply personal, unique process of changing one’s attitudes, values, feelings, goals, skills and/or roles. It is a way of living a satisfying, hopeful, and contributing life even with limitations caused by the illness. Recovery involves the development of new meaning and purpose in one’s life as one grows beyond the catastrophic effects of mental illness.”

William Anthony
Filling the Gap

Integration of Primary and Mental Health Care

Mental health and primary care systems have evolved to operate separately. For example, practices such as attention to multiple conditions and health maintenance common in primary care have been lacking in mental health treatment.

As systems moved away from institutional care to community based care, initial focus has been on mental health treatment such as community mental health centers that do not provide primary care.

Growing interest in creating medical homes or finding ways to incent the integration of both systems of care.
Why the interest now after all of these years?

- The President’s New Freedom Commission Report in 2000 called for transformation of mental health systems of care to improve access, emphasize early intervention and recovery
- This is leading us to a more holistic Public Health approach and recognition of the need to partner and integrate all systems of care: mental health, substance abuse, primary care
- The study pointing out people with mental illness die 25 years younger than general population and rise in metabolic conditions such as diabetes
- Recognition of disparity in healthcare and healthcare coverage for persons with serious mental illness
- Escalating costs, in part resultant from lack of attention to wellness, prevention and overall healthcare
What are the first five (5) positive words that come to mind when you think of mental health?
What are the first five (5) negative words that come when you think about mental illness?
